

# Modeling Network Diffusion: From Pathogens to Products

PJ Lamberson

Kellogg School of Management and NICO

$$id > \tau$$

tipping point

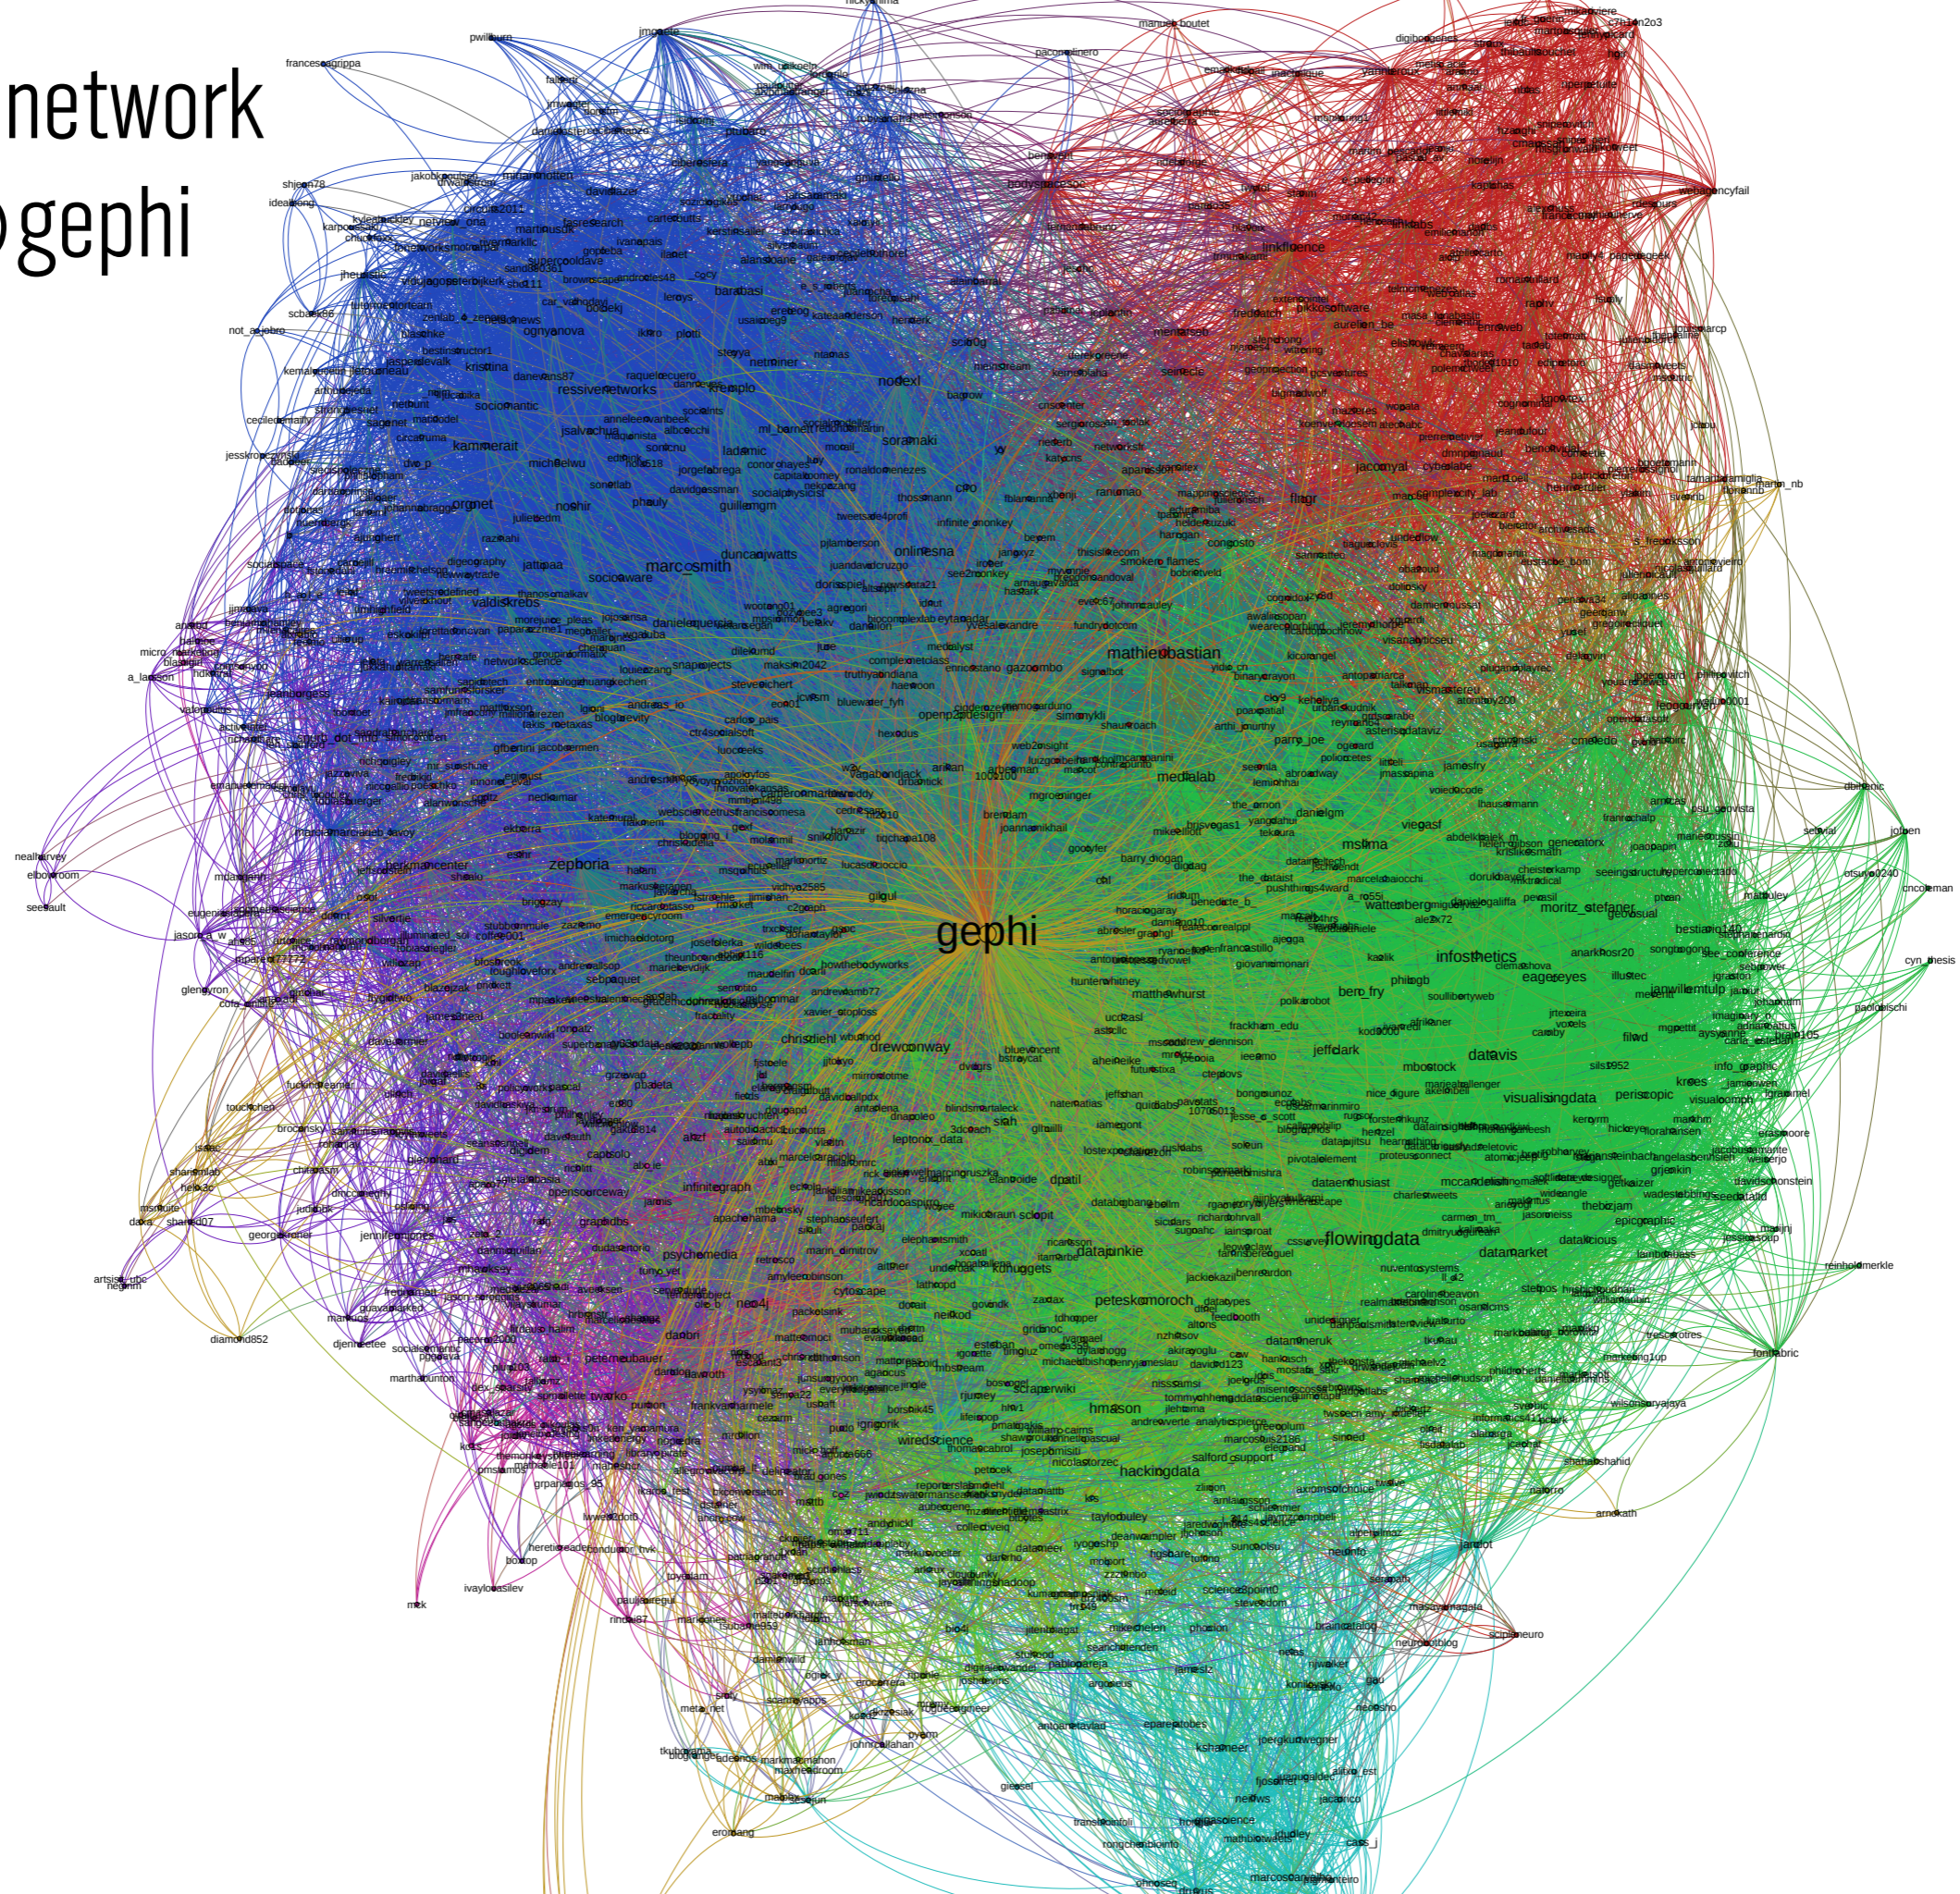

The tipping point  
depends on the network

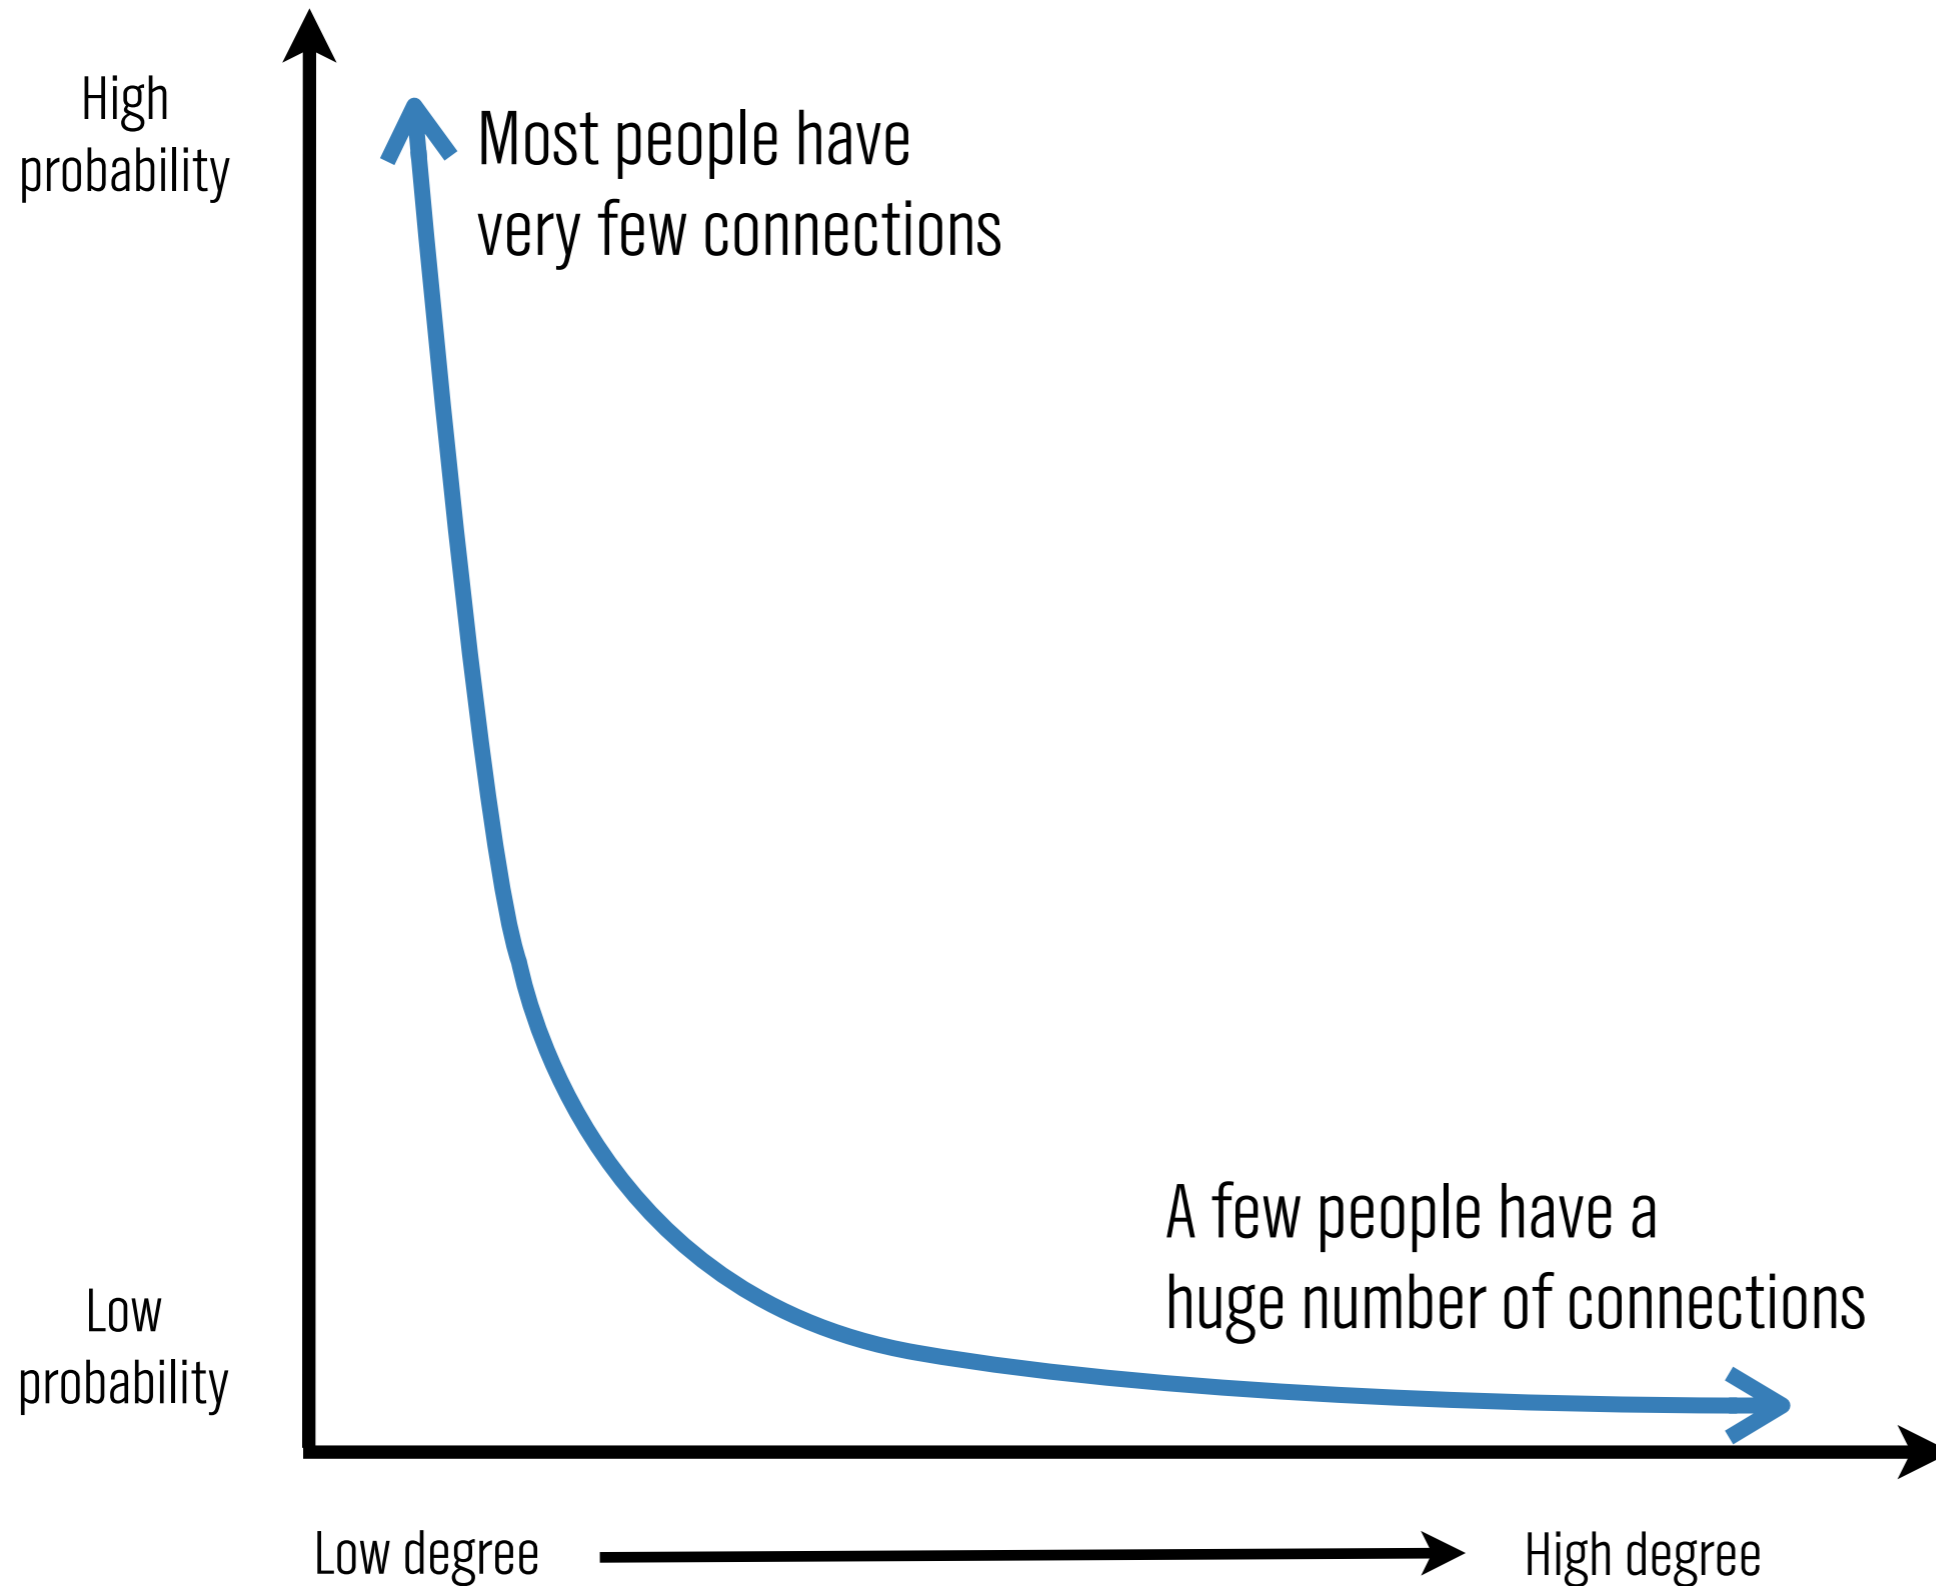

$$id > \tau(\text{network})$$

Data from J. J. Potterat, L. Phillips-Plummer, S. Q. Muth, R. B. Rothenberg, D. E. Woodhouse, T. S. Maldonado-Long, H. P. Zimmerman, and J. B. Muth, "Risk network structure in the early epidemic phase of HIV transmission in Colorado Springs," *Sexually Transmitted Infections*, 78 (2002), pp. i159-i163.

# Twitter network of @gephi

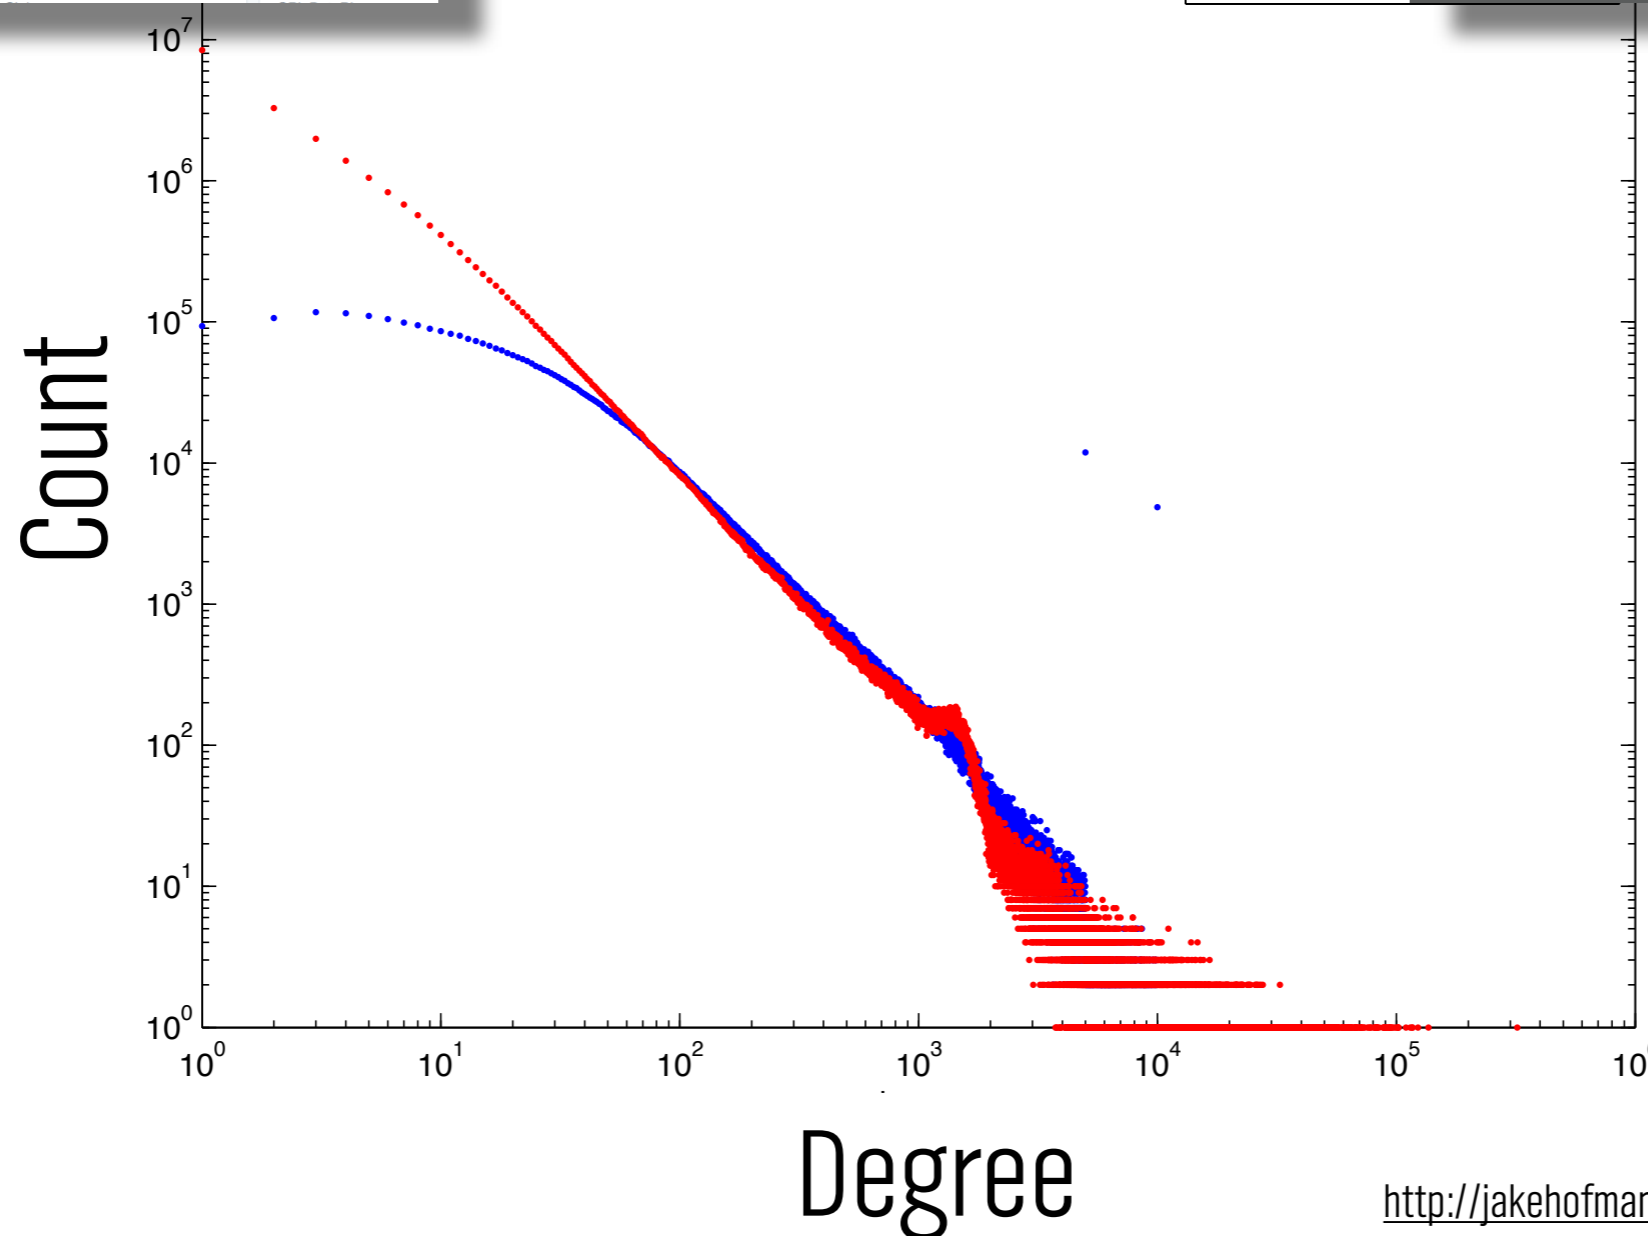

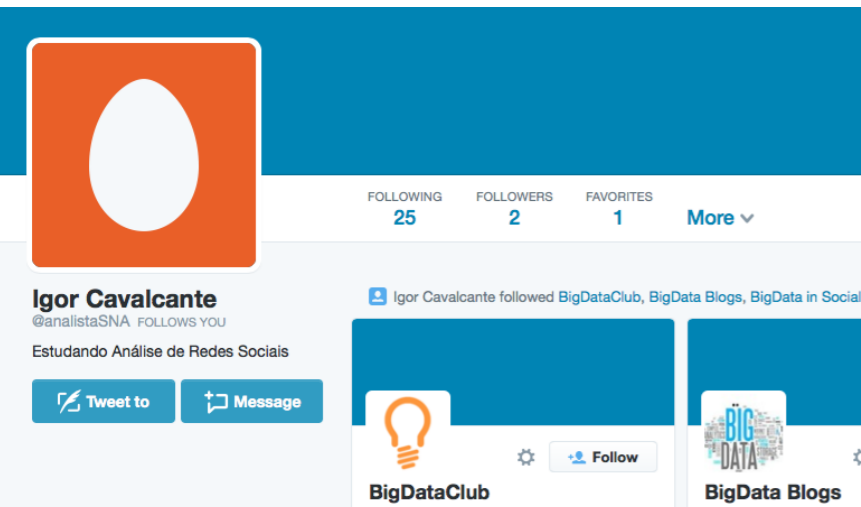

# Scale Free Networks

# My Facebook network

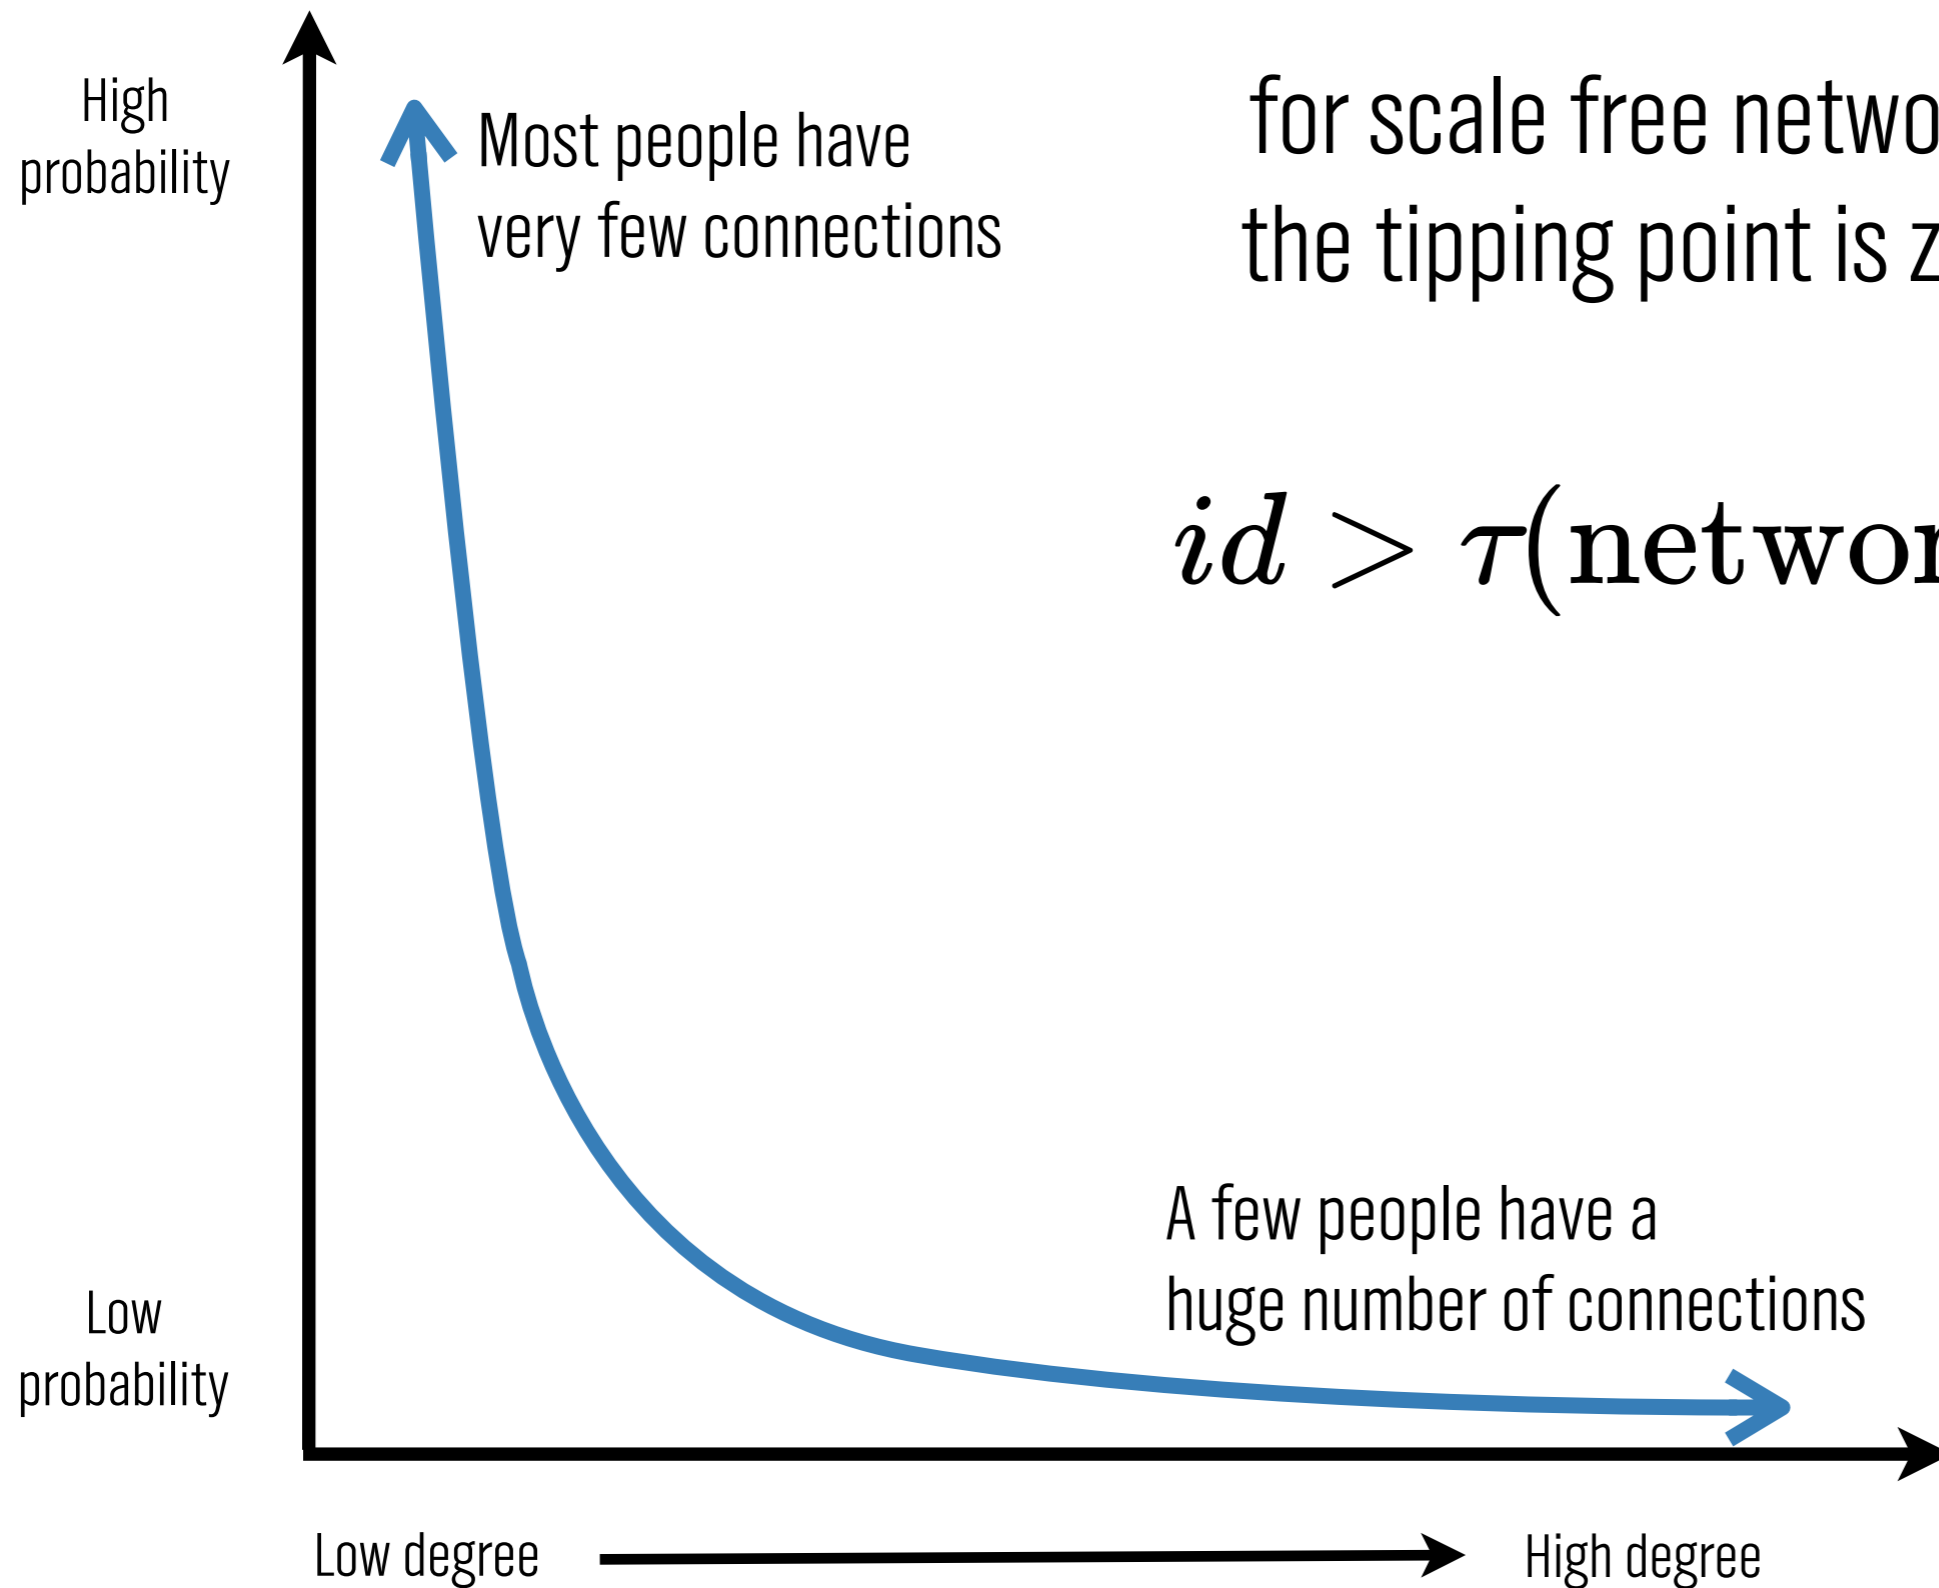

# Twitter Degree Distribution

(from crawl of 25m nodes)

# Scale Free Networks

for scale free networks  
the tipping point is zero

$$id > \tau(\text{network}) = 0$$

# Twitter Cascades

74 million chains initiated by more than 1.6 million users during two months in 2009

98% of URLs  
were never  
reposted

# YouTube Views

# Threshold Model

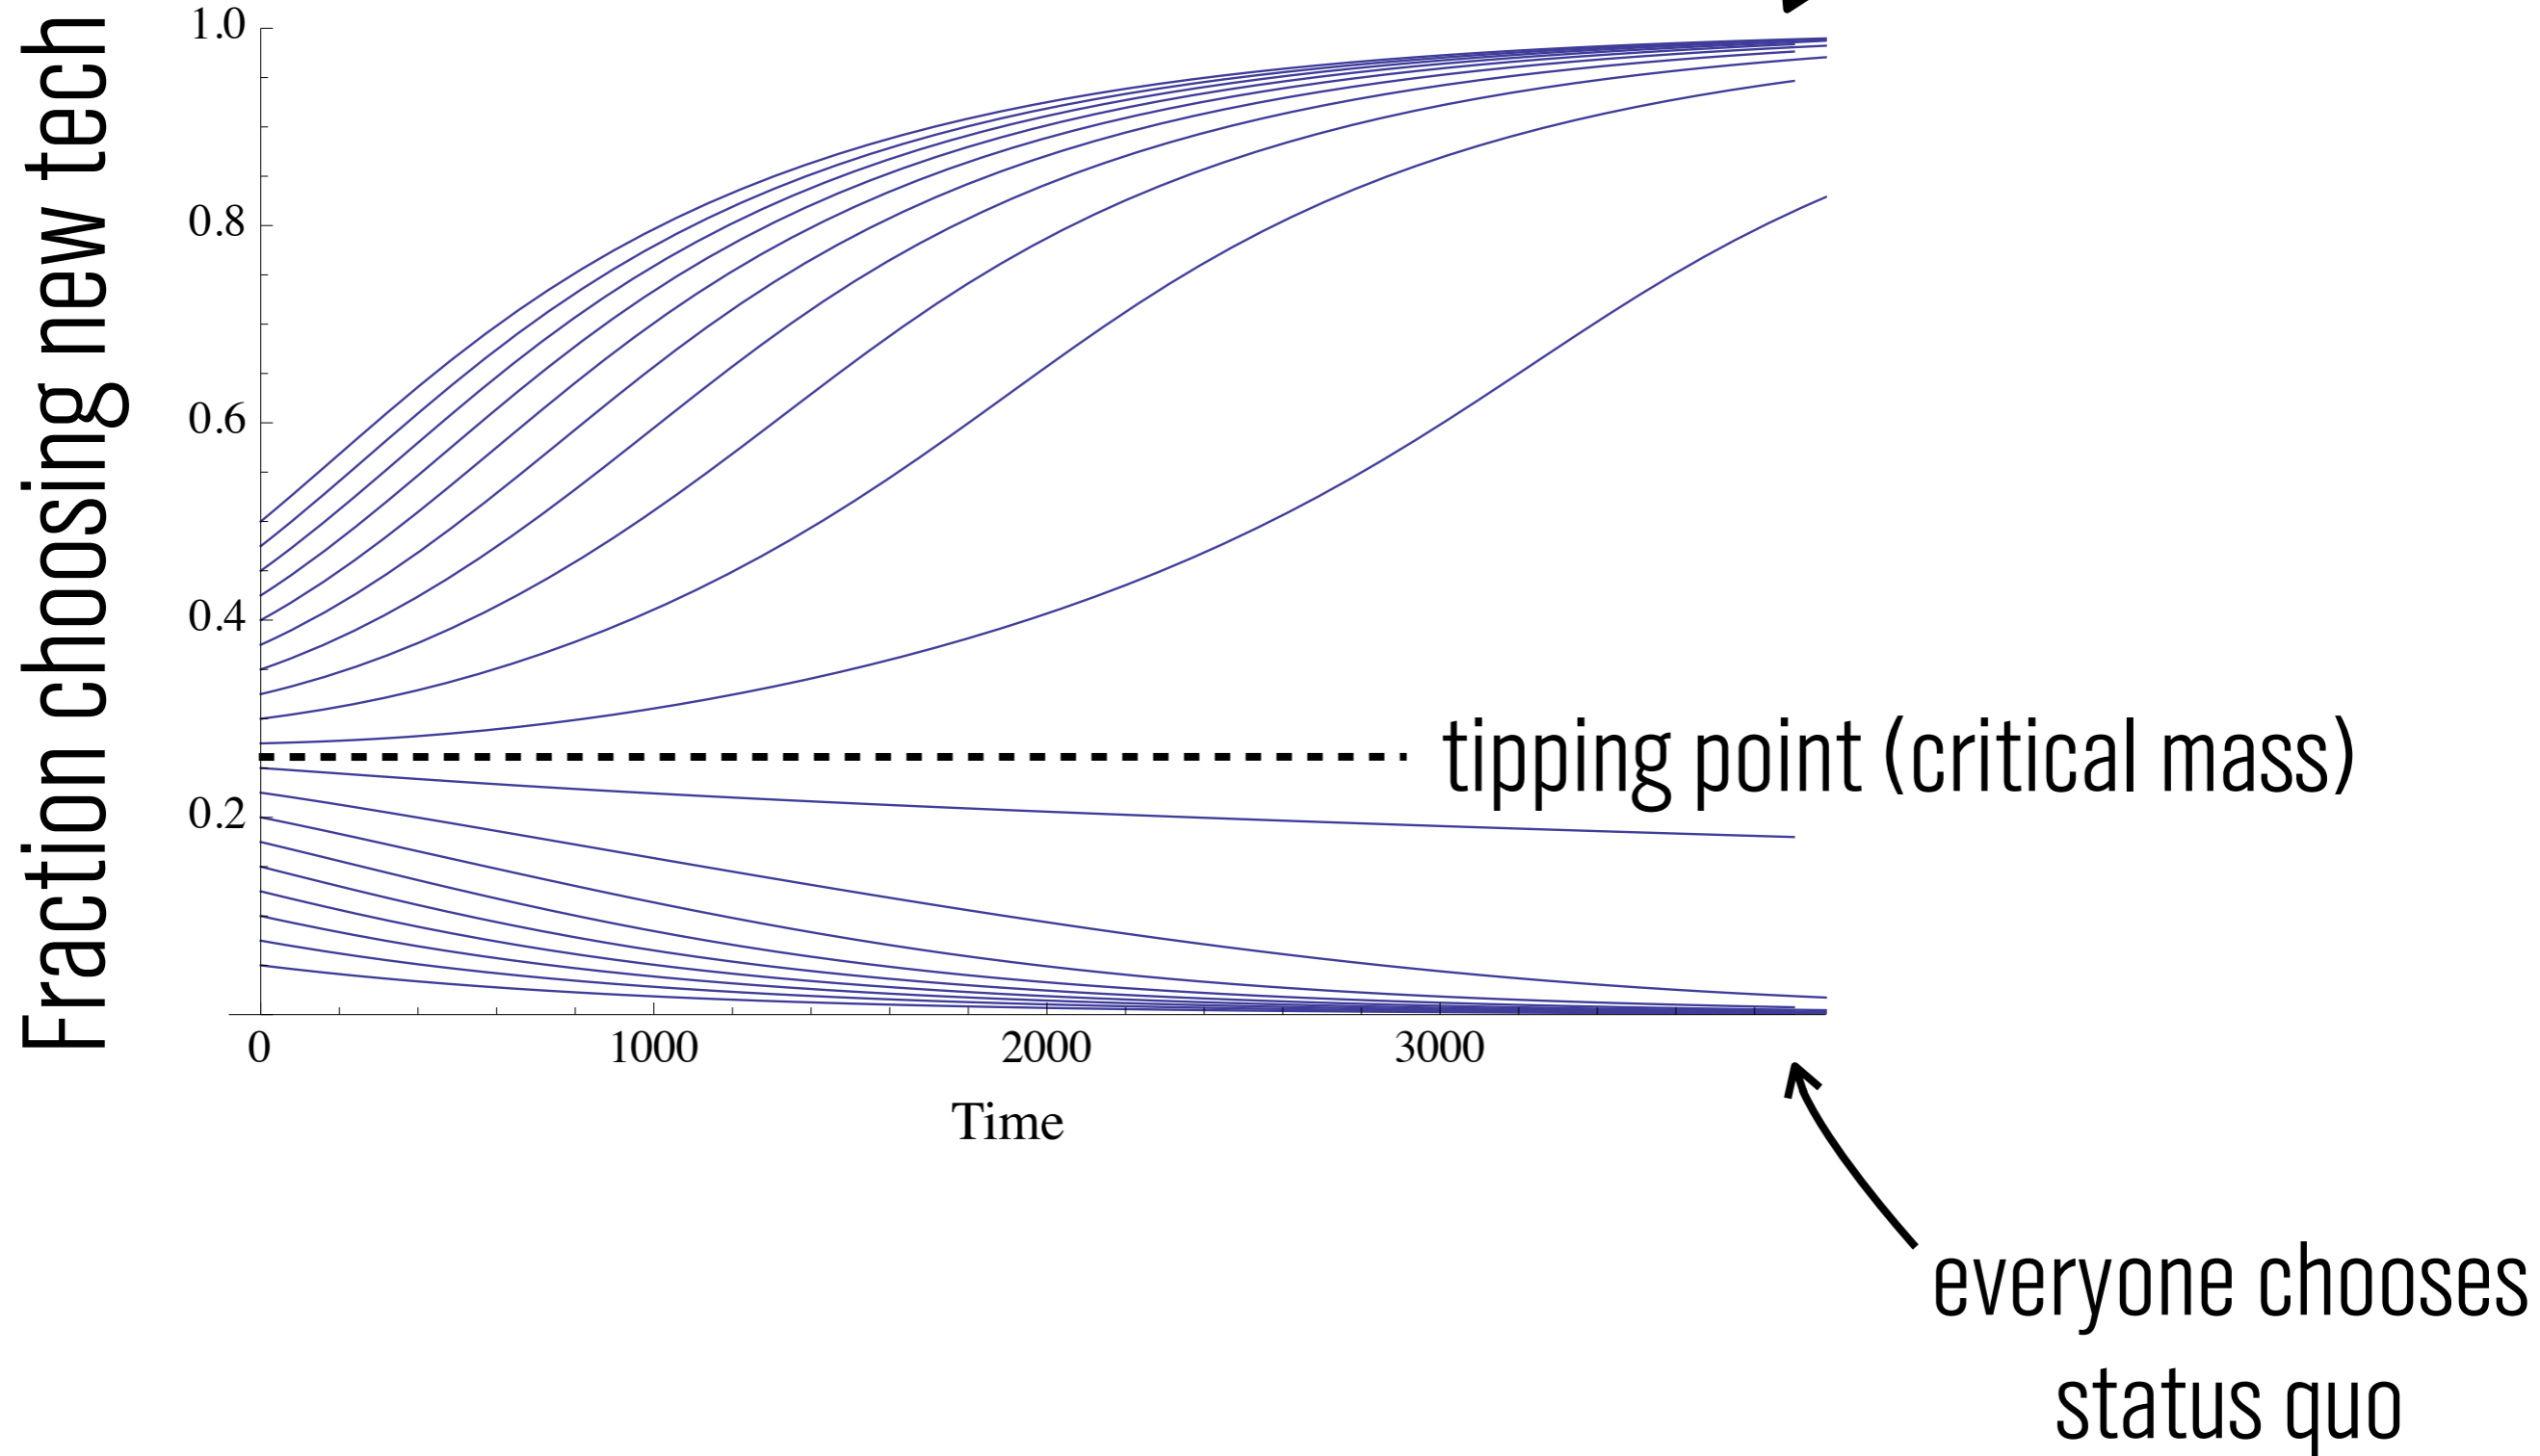

Adopt once threshold number of friends adopt

**myspace**

# Threshold Model

clustering coefficient: the probability two people with a mutual friend are friends with each other

clustering: .4

clustering: .0375

Increased clustering makes the critical mass lower for the better technology

“Once the **exclusive** online stomping grounds of college students, social networking site Facebook.com is throwing open the doors to rest of the world.

The growth move is **fraught with risk** for the company, whose more than 9.3 million registered users are intensely attached to the site because it lets them **connect to a select group of peers.** ... the company risks being viewed as a second-rate version of **MySpace**, the famously open social network that now receives more than 46 million visitors per month.”
